Roots, intercepts, symmetry and turning point

6 questions | 14 marks

Equivalent correct methods earn the corresponding marks.

1. For $y=(x+2)(x-4)$, state both x-intercepts. [2 marks]

$x+2=0$ or $x-4=0$.

Answer: $(-2,0),(4,0)$

2. Find the y-intercept of $y=x^2-6x+8$. [2 marks]

Substitute $x=0$.

Answer: $(0,8)$

3. Find the axis of a parabola with roots 3 and 9. [2 marks]

$\frac{3+9}{2}=6$.

Answer: $x=6$

4. Find the turning point of $y=(x-2)(x-6)$. [3 marks]

The axis is $x=4$.

At 4, $y=2(-2)=-4$.

Answer: $(4,\ -4)$

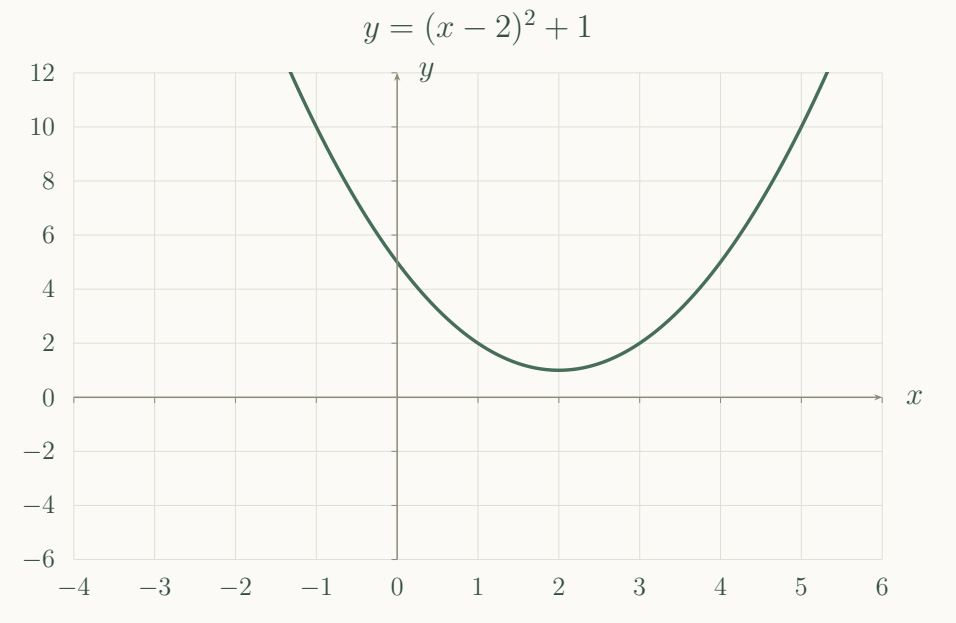

5. Find the turning point of $y = -x^2 + 9$ and state its type. [2 marks]

The axis is $x = 0$ and $y = 9$ there.

The parabola opens downwards.

Answer: $(0, 9)$, maximum.

6. Use the graph to give the minimum value and the number of real roots of $y = (x - 2)^2 + 1$. [3 marks]

The lowest point is $(2, 1)$, above the x-axis.

The curve never reaches $y = 0$.

Answer: Minimum 1; no real roots.
